1. Problem Statement

Sesha is developing a weather monitoring system for a region with multiple weather stations. Each weather station collects temperature data hourly and stores it in a 2D array.

Write a program that can add the temperature data from two different weather stations to create a combined temperature record for the region.

Input Format

The first line of input consists of two space-separated integers N and M, representing the number of rows and columns of the matrices, respectively.

The next N lines consist of M space-separated integers, representing the values of the first matrix.

The following N lines consist of M space-separated integers, representing the values of the second matrix.

Output Format

The output prints the addition of the two matrices in N rows and M columns, representing the combined temperature record.

Refer to the sample output for formatting specifications.

Answer

```
import java.util.*;
class Main{
    public static void main(String arg[]){
        Scanner in=new Scanner(System.in);
        int a,b;
        a=in.nextInt();
        b=in.nextInt();
        int arr1[][]=new int[a][b];
        int arr2[][]=new int[a][b];
        int arr[][]=new int[a][b];
        for(int i=0;i<a;i++){
            for(int j=0;j<b;j++){
                arr1[i][j]=in.nextInt();
